Warranty

Forest Kings Tub website · Last updated: 10 November 2026

1. Statutory warranty

All goods you buy from MB Europaletes, Vytauto g. 9, Meškučių k., LT-68129 Marijampolė, Lithuania ("we", "us"), are covered by the statutory warranty rights (liability for defects). For consumers, the statutory warranty period for new goods is two years from delivery. Mandatory consumer protection provisions of the country in which you have your habitual residence remain unaffected.

We do not give any additional commercial warranty (in particular no manufacturer's warranty). Your rights arise solely from the law and are free of charge for you.

If the goods are defective on delivery, you can, in accordance with the law, first ask us to bring them into conformity, at your choice by repair or by replacement with goods free of defects. If this is not successful, you can, under the statutory conditions, reduce the price or terminate the contract, and claim damages. We bear the costs of bringing the goods into conformity (for example transport, labour and material costs).

2. Reporting a defect

Please report a defect to info@forestkings.com or by telephone on +370 620 46372, with a short description and photos. We will get back to you quickly and agree the next steps. Reporting quickly helps us to fix the defect fast and to avoid further damage; your statutory rights, however, do not depend on it.

Please note visible transport damage on the delivery receipt and tell us about it, if possible within 48 hours; this helps us to claim against the carrier. This, too, does not limit your statutory rights.

3. What is normally not a defect

Whether a defect exists is determined by the law and by the agreed and usual characteristics of the goods. The following notes describe typical cases in which, in our experience, there is no defect; they do not limit your statutory rights.

- **Wood exposed to the weather:** wood is a natural material. If the hot tub stands outdoors, rain, snow and sun can make the wooden cladding swell, shrink, warp, change colour or crack; with constant moisture, mould and rot can develop.
- **Natural wear and wear parts:** for example the thermal cover, which ages over time due to sun, frost, rain and snow.
- **Damage caused by improper use or missing care:** for example firing the stove without water or draining the water before the stove has cooled down; burning coal; using chlorine, unsuitable cleaning products, acetone or thinners; water freezing in the tub; foreign objects in the liner or in the pump; walking in the tub with footwear; sitting on the edge of the liner.
- **Deposits and contamination:** limescale or iron deposits, and sand, gravel or sludge in the water circuit.
- **Damage to electrical parts caused by external influences:** for example power surges, short circuits or unsuitable mains voltage at the pump or the LED power supply.

- **Fine hairline cracks in the top layer** of the liner that do not affect watertightness or function and are caused by external impact. A crack through all layers from which water leaks, however, is a defect.
- **Modifications or repairs by third parties** not arranged by us, and damage caused by force majeure (for example fire, lightning, storm).

4. Our recommendations for a long service life

To reduce the influence of the weather, we recommend thermally treated wood, plastic (WPC) cladding or similar. Place the hot tub in a well-ventilated location, ideally under a roof (shelter, gazebo, open or enclosed terrace with a roof). If snow lands on the thermal cover, please clear it off so that the cover is not overloaded and does not break.

Do not place the hot tub directly on bare ground. Raise it so that the base does not come into direct contact with the ground, moisture or snow.

Impregnate the hot tub once a year with an impregnating agent of your choice or one recommended by us.

Do not clean the hot tub with acidic, alkaline, abrasive or chlorine-containing products. Do not use acetone or thinners, as they permanently change the appearance of the liner. Use only cleaning products intended for swimming pools.

To keep the stove and the hot tub in good condition for a long time, we advise against chlorine, bubble and foaming additives and similar products. Use only clean water with a normal iron content and water that is not too hard, so that limescale does not form.

Always fill the hot tub with water before you light the stove, and drain the water only when the stove has cooled down completely. Follow the user manual supplied with your hot tub.
